

In today's world of extreme specialization, every department prefers to have their own specialized application that helps them in not only automating but also collaborating and managing their day to day activity.

From an IT department perspective, this means managing that many different applications and servers. Multiple Applications directly translate to that many Access Controls, Disparate Data Sets, Physical Servers and Networking Infrastructure. Managing them becomes a tedious and arduous task.

What We Provide:

We provide solutions to consolidate all these disparate systems to a manageable minimum without compromising on security, performance or ease of use or management. Our approach is a mix of the tried and test methods of step-by-step consolidation of applications, data sets and eventually physical servers. We finally throw in good amounts of modern server and storage virtualization solutions to cut down the actual infrastructure a manageable size.
